Google Ads API — Token Application

Company Name: Dropscale IO

Business Model

Dropscale IO is a digital marketing agency. We plan, launch and manage Google Ads campaigns on behalf of our clients, who are independent e-commerce businesses running Shopify stores. We do not sell products ourselves, and we do not resell the Google Ads API or any tool built on it.

Each client owns their own Google Ads account and their own Shopify store. We are granted access to those accounts by the client in order to run their advertising. We are paid by the client for that service: a management fee calculated as a percentage of the ad spend we manage (10% by default), and, on some accounts, an agreed percentage of the store revenue that our campaigns generate. Nothing we charge is based on reselling API access.

Tool Access / Use

The tool is a private web application at **dropscale.app**. It is not a product we sell, and it is not available to the public — there is no sign-up that grants access to anyone outside the two groups below.

1. Our own staff (admin area). Account managers and the agency's finance staff use it to review performance across all the accounts we manage, to see which campaigns are running, and to reconcile what each client should be invoiced.

2. Our clients (client portal). Each client signs in and sees the performance of **their own advertising accounts only** — spend, impressions, clicks, conversions, ROAS — alongside the sales data from their own Shopify store, so they can see the real profit of their campaigns. A client can never see another client's data; every query is scoped to the signed-in account at the database level (PostgreSQL row-level security).

A client connects their Google Ads account themselves, through Google's standard OAuth consent screen. They can revoke that access at any time from their own Google account. We never ask a client for their Google credentials.

The tool is **read-only with respect to Google Ads**. It does not create, edit, pause or remove campaigns, ad groups, ads, budgets or keywords. All campaign management is carried out by our team directly in the Google Ads UI; the tool only reports.

Tool Design

Authentication. Each advertising account is connected via OAuth 2.0 (<https://www.googleapis.com/auth/adwords>). The resulting refresh token is encrypted (AES-GCM) before it is stored, and is only ever decrypted server-side to make an API call.

Data flow. The application queries the Google Ads API for performance metrics and stores the results in our own database (PostgreSQL) as a daily rollup: one row per advertising account per day, holding spend, impressions, clicks, conversions and conversion value. The dashboards read from that rollup, not from the API — so ordinary page views cost no API calls.

Refresh cadence. The rollup is refreshed when a user opens a page that depends on it, and at most once every 15 minutes per account; a request within that window is served from the stored data. Each refresh pulls a rolling 7-day window so that Google's restatements of recent days are picked up. When an account is connected for the first time, we backfill up to 90 days once, so the client's dashboard is not empty on day one.

Reporting. Users can view performance at account level and campaign level, over a date range they choose (today, yesterday, last 7/30 days, month to date, year to date, or a custom range). The same data feeds the agency's internal invoicing figures.

No write operations. The application performs no mutate calls of any kind against the Google Ads API.

API Services Called

Service	Method	Use
CustomerService	ListAccessibleCustomers	After OAuth consent, list the advertising accounts the connecting user has granted us access to, so they can pick the right one.
GoogleAdsService	Search	All reporting. GAQL queries only — no mutates.

The `GoogleAdsService.Search` queries read from these resources:

- **customer** — account-level metrics (impressions, clicks, cost, conversions, conversion value) by day, for the dashboards and the daily rollup.
- **campaign** — campaign name, status and per-campaign metrics for the campaign-level reporting table.
- **asset** — image assets from the account's asset library, so the client can review the creatives running on their account.

No other Google Ads API services are called.

Tool Mockups

Attach these four screenshots of the tool:

1. **Client portal — dashboard.** Revenue, net profit, ad spend, ROAS, the daily performance chart and the cost breakdown.
2. **Client portal — store performance.** The 10-metric grid (amount spent, impressions, clicks, conversions, CTR, CPC, cost/conversion, ROAS, conversion value) and the campaigns table underneath.

3. **Admin area — campaigns.** All managed clients, expandable per store, with each store's campaigns and spend.

4. **Connection screen.** Where a client starts the Google OAuth consent flow for their own advertising account.

Dropscale IO — prepared for the Google Ads API access application.
